

rural fiber / mat / agricultural surfac - Haryana

V1 — Authentic Style

Universal Hard Prompt

Create an image in the authentic source-faithful visual logic of a **Haryana rural fiber-construction world**, rooted in **Sarkanda and Moonj craft**. Treat this as a **reed, rope, mat, and agricultural-surface system**, not as generic rustic decor, not as boho woven styling, not as wicker luxury furniture, and not as decorative straw patterning.

Build the whole image as if it comes from a real Haryana village material culture where **sarkanda stalk, moonj rope, binding, cross-lay, tightening, and compression** generate the form. The beauty must come from **structure**, not from ornament pasted on top. The material must feel **dry, fibrous, sun-exposed, tension-held, handmade, load-bearing, and rural-use-ready**.

Surface logic: create the visual field through **rope intervals, crossed members, woven webs, compressed bundles, reinforced rims, bound edges, and repeated structural rhythm**. Pattern must emerge from construction itself: from crossing, wrapping, spacing, tightening, and edge-locking. Do not create graphic motifs first and then add straw texture later.

Object-world logic: if stools, charpai-like surfaces, mats, blinds, baskets, low furniture, partitions, or agricultural utility objects appear, they must feel **structurally real**. A **muda-like stool** should feel low, compressed, circular or cylindrical, tensioned on top, and reinforced at the perimeter. A **charpai-like surface** should feel stretched and load-bearing. A **basket-like form** should feel swelling, bound, rimmed, and storage-ready. A **mat or blind** should feel planar, repeated, dry, and spread or hung for use.

Material logic: preserve the difference between **stiff stalk/reed members** and **twisted moonj rope**. Reed should feel rigid and linear. Rope should feel tensile, binding, and structurally active. Let the object show pressure, pull, friction, use, and hand-tightened construction. Slight irregularity is allowed, but the result must still feel exact enough to hold weight and survive use.

Color logic: keep the primary color world rooted in the material itself — **straw beige, dry yellow, dusted tan, warm brown, muted olive, smoke-darkened fiber, rope-burnished neutral**. Any secondary color should feel like structural accent or border binding, not painted decoration.

Do not make this generic eco-friendly furniture, bamboo/cane luxury, random village texture, or styled natural-fiber decor. The final image must feel like true Haryana rural fiber construction: **reed-bodied, moonj-bound, tension-built, compression-shaped,**

edge-reinforced, and born from practical village utility surfaces. This follows the official Sarkanda craft framing and the InCH description of moonj ropes creating web-like structures on charpai and muda.

Reusable Variable Template

Create **[SUBJECT / OBJECT / SCENE]** in the authentic source-faithful visual logic of a **Haryana rural fiber / mat / agricultural surface system**, rooted in **Sarkanda and Moonj craft**.

Core style system to preserve:

- reed-and-rope material body
- clear difference between rigid stalk and twisted rope
- cross-lay / web / bind construction
- visible tension and compression
- edge reinforcement and wrapped terminations
- utility-first object truth
- dry vegetal surface memory
- rural Haryana use ecology
- whole-object structural coherence

Translate the scene like this:

[MAIN OBJECT OR MAIN SURFACE] becomes a true Sarkanda/Moonj-built structure rather than decorative rustic furniture

[SECONDARY OBJECTS OR SUPPORTING SURFACES] become woven, webbed, bound, or compressed units governed by the same construction logic

[TOP / SPAN / WEB] should feel load-bearing and tensioned

[SIDE / RIM / BORDER / TERMINATION] should feel reinforced, wrapped, compressed, and structurally finished

[SURFACE RHYTHM] should emerge from crossing, spacing, braiding, and repetition rather than applied pattern

[RURAL CONTEXT] should feel practical, handled, used, sun-exposed, and village-rooted

Keep:

- material truth
- structural tension
- reed/rope distinction
- utility-object logic
- construction-born rhythm
- rural-use memory
- whole-object coherence

Avoid:

- generic wicker
- boho fiber styling
- bamboo luxury furniture

graphic pattern over straw
decor-first object design
soft fabric-like weave
synthetic polish

Image-to-Image

Convert this source image into the authentic source-faithful visual logic of a **Haryana rural fiber / mat / agricultural surface world** rooted in **Sarkanda and Moonj craft**.

Preserve the source image's main object count, core function, and general readability, but rebuild the entire visual system through **reed body, moonj rope, cross-lay structure, tension, compression, and edge reinforcement**. Replace generic rustic styling, random natural-fiber texture, or luxury wicker language with a true **Haryana village construction logic**.

If the source image contains stools, chairs, mats, baskets, webbed surfaces, partitions, or low furniture, reconstruct them so they feel made from **rigid stalk members plus twisted rope under tension**. If the source image contains surfaces, make those surfaces feel structurally woven or webbed, not merely textured. If the source image contains decorative geometry, make the geometry arise from actual construction rhythm rather than graphic design.

Do not paste straw texture onto an existing object. Do not keep another furniture grammar underneath. Do not let the result become generic eco-decor. Rebuild the whole image so it feels as if the source scene originally emerged from a real Haryana Sarkanda/Moonj craft world: **dry, structural, bound, compressed, utility-born, and tension-held**. Official sources support this by defining the craft through Sarkanda grass and moonj ropes used in muda, charpai, baskets, mats, and blinds.

V2 — Artisan Translation

Universal Hard Prompt

Create a creative **2D + 3D translation** rooted in the visual grammar of a **Haryana rural fiber / mat / agricultural surface world**, based on **Sarkanda and Moonj craft**. This must not become generic eco-furniture, lifestyle rustic styling, or decorative lattice design. It should feel like authentic Haryana rural fiber intelligence expanding into a richer image-world while still remaining **structure-first, tension-first, material-first, and utility-born**.

Keep the native engine intact: **reed body, twisted moonj rope, cross-lay construction, web tension, compression, bound edges, and object-world truth**. Then allow a controlled expansion where the world gains more articulated surface depth, stronger relation between open web and compressed body, richer edge systems, and more expressive structural rhythm. Depth may appear only as **rope relief, bundle thickness, layered crossings, rim buildup, shadow inside the web, and bound structural density**, never as luxury finish or decorative styling.

Object logic: let the object-world become richer but still believable. A stool can become more tactile and constructionally expressive, but it must still feel like a real load-bearing rural object. A mat can become more visually layered, but must still feel spreadable and practical. A charpai-like span can become more dimensional, but it must still feel pulled under usable tension. A basket can become more structurally legible, but it must still feel made for carrying or containing.

Surface logic: allow structural geometries such as **squares, diamonds, zigzags, and border braids** to become more visually articulate, but only as consequences of woven or bound construction. Keep the material dry, fibrous, and honest. The world should feel more fully inhabited by Haryana fiber logic, not more decorated.

Do not make this into boho-chic woven furniture, generic sustainable product rendering, or a natural-fiber fantasy surface. The final image must feel like Haryana Sarkanda/Moonj logic creatively expanded while still remaining **reed-bodied, rope-tensioned, structurally compressed, and rural-use-rooted**. The official and InCH sources both support this because they describe a living craft system that extends from basic utility into broader product worlds while preserving the same material basis.

Reusable Variable Template

Create **[SUBJECT / OBJECT / SCENE]** as a creative **2D + 3D translation** rooted in the visual grammar of a **Haryana rural fiber / mat / agricultural surface system** based on **Sarkanda and Moonj craft**.

Preserve these style-core rules:

- reed and moonj remain primary
- stalk-versus-rope contrast remains visible
- cross-lay / web construction remains structural
- tension remains believable
- compression and binding remain active
- utility-object truth remains intact
- rural-use memory remains present
- whole-object coherence remains intact

Translate the scene like this:

[MAIN OBJECT OR SURFACE] becomes a richer Sarkanda/Moonj-built structure with stronger tactile and structural presence

[SECONDARY ELEMENTS] become supporting reed/rope forms governed by the same construction logic

[WEB / PLANE / BODY RELATION] becomes more articulated through depth, relief, and interval structure

[RIM / BORDER / TERMINATION] becomes more clearly reinforced and constructionally expressive

[SURFACE RHYTHM] becomes richer through structural repetition rather than graphic decoration

[RURAL CONTEXT] remains grounded in utility, handling, use, and Haryana village ecology

Let these become richer:

- rope relief
- bundle thickness
- edge complexity
- structural rhythm
- negative-space intervals
- object-world presence

Keep unchanged:

- material truth
- tension logic
- utility identity
- reed/rope distinction
- construction-born geometry
- rural-use grounding
- whole-object coherence

Avoid:

- boutique eco decor
- wicker luxury
- bamboo styling
- boho pattern language
- soft atmospheric weave
- decorative geometry detached from structure
- surface beauty replacing object truth

Image-to-Image

Convert this source image into a creative **2D + 3D Haryana rural fiber translation** rooted in **Sarkanda and Moonj craft**.

Preserve the source image's object count, overall function, and main compositional readability, but rebuild every major form through **reed body, moonj rope, structural crossings, tension, compression, and edge reinforcement**. Let the result become more materially rich and spatially articulate than a basic craft sample, while still remaining unmistakably part of a **Haryana utility-object world**.

If the source image contains stools, chairs, mats, partitions, baskets, or webbed surfaces, reconstruct them so they show a richer internal logic between **rigid members, tensile ropes, compressed borders, and woven spans**. If the source image contains geometric repetition, make it emerge from actual structure. If it contains open gaps or spans, make them feel like real web intervals under use.

Do not simply add rustic fiber detail to a normal object. Do not keep generic furniture logic underneath. Do not turn it into contemporary decor fantasy. Rebuild the whole image so it feels as if the source scene naturally expanded into a more expressive Haryana Sarkanda/Moonj world while preserving **tension, compression, utility truth, and material honesty**.

V3 — 3D / Realistic / Cinematic Translation

Universal Hard Prompt

Create a believable **full 3D realistic dimensional world** generated from the visual grammar of a **Haryana rural fiber / mat / agricultural surface system** rooted in **Sarkanda and Moonj craft**. This is not a realistic rustic object with woven texture added later. It is a fully dimensional world in which **reed body, moonj rope, cross-lay structure, web tension, compression, edge reinforcement, and rural utility-object logic** have become materially real.

Convert the entire style system into dimensional reality without losing its laws. The objects must still feel **load-bearing, tension-held, hand-tightened, and village-use-ready**. A stool must still feel structurally resolved through wrapped rim, compressed side, and tensioned top. A charpai-like span must still feel woven under pull. A mat must still feel spread from repeated vegetal members. A basket must still feel contained by structural bulge, rim pressure, and fiber memory. A blind or partition must still feel planar, hanging, and function-driven.

Material logic: let the fiber become fully tactile — dry, rough, rope-twisted, sun-dulled, and structurally real. Show the difference between **rigid reed body** and **tensile moonj rope** clearly. Let shadows deepen inside webs, let pressure show along contact points, let edge bindings thicken where they must hold the form. Realism must strengthen the construction truth, not turn the craft into boutique styling.

Surface logic: the repeated geometry should still come from real structure. Do not make the object look upholstered, polished, machine-woven, or cane-luxury finished. The whole world must feel built through **manual pressure, vegetal material economy, and Haryana rural utility logic**.

Do not create generic wicker realism, boho-interior furniture, eco-luxury handmade product photography, or decor objects with natural-fiber skins. The final image must feel like a fully dimensional Haryana Sarkanda/Moonj world: **reed-built, rope-tensioned,**

compression-held, edge-reinforced, utility-born, and materially honest. The source grounding for this comes directly from the official Sarkanda craft description and the InCH account of moonj ropes making web-like structures on charpai and muda.

Reusable Variable Template

Create **[SUBJECT / OBJECT / SCENE]** as a believable **full 3D realistic dimensional world** generated from the visual grammar of a **Haryana rural fiber / mat / agricultural surface system** based on **Sarkanda and Moonj craft**.

Style system that must remain unchanged:

- reed body remains primary
- moonj rope remains the tension-bearing element
- cross-lay / web structure remains visible
- compression and edge reinforcement remain structural
- utility-object truth remains active
- rural Haryana ecology remains present
- geometry still emerges from construction
- the whole object belongs to one Sarkanda/Moonj world

Translate the scene like this:

[MAIN OBJECT OR SURFACE] becomes a fully dimensional Haryana fiber-built form with real structural logic

[SECONDARY ELEMENTS] become materially convincing supporting forms built from the same reed-and-rope system

[TOP / SPAN / WEB] becomes realistically tensioned and load-bearing

[SIDE / BODY / RIM] becomes compressed, reinforced, and structurally resolved

[SURFACE RHYTHM] remains construction-born, not decor-applied

[RURAL CONTEXT] remains tied to use, touch, pressure, and village life rather than to styled interiors

Increase:

- fiber tactility
- rope realism
- compression truth
- edge-lock realism
- surface tension
- utility-object presence

Do not lose:

- material honesty
- stalk-versus-rope distinction
- load-bearing logic
- construction-born geometry
- rural-use memory
- whole-object coherence

Avoid:

- wicker luxury realism
- boho product styling
- cane/bamboo substitution
- decor-first rendering
- printed or upholstered feel
- pattern detached from structure
- any object that forgets Haryana Sarkanda/Moonj construction logic

Image-to-Image

Convert this source image into a believable **full 3D Haryana rural fiber world** generated from **Sarkanda and Moonj craft**.

Preserve the source image's object count, core function, and main compositional readability, but rebuild every major element through **reed body, moonj rope, structural crossings, tension, compression, and reinforced edges**. Replace generic rustic styling, wicker realism, or lifestyle decor language with a fully coherent Haryana construction world.

If the source image contains stools, chairs, baskets, mats, blinds, or webbed surfaces, reconstruct them so they show real differences between **rigid vegetal members, tensile rope spans, compressed sidewalls, and bound perimeters**. If the source image contains repeated geometry, make it emerge from actual weaving or binding logic. If the source image contains wear, make it feel like use-memory from pressure, handling, and rural life rather than artificial distress.

Do not simply add realistic straw texture to an existing object. Do not keep generic furniture or decor grammar underneath. Do not let it become eco-luxury product realism. Rebuild the whole image so it feels as if the source scene originally emerged from a fully dimensional Haryana Sarkanda/Moonj material world: **reed-built, rope-bound, tensioned, compressed, structurally honest, and rural-use-rooted**.
