

bamboo - Meghalaya

V1 — Authentic Style

Universal Hard Prompt

Create an image built from the traditional bamboo-and-cane construction world of Meghalaya. Do not treat this as generic eco craft, generic basketry, generic woven decor, or a normal world with bamboo texture added later. Build the entire image as if it is generated by a split-strip utility-object civilization where weave, bind, rim, lattice, conical structure, shield logic, carrying logic, and lightweight assembly control every decision.

The image must obey this bamboo grammar:

- the world is generated from split-strip construction, not monolithic mass
- forms must feel woven, bound, bent, rimmed, latticed, hollow, and use-born
- the dominant visual intelligence must come from structural assembly, not surface pattern
- baskets, shields, mats, partitions, and utility forms must feel constructable and real
- every major form must feel as if it could be split, woven, bent, tied, carried, or used
- lightweight structure must remain visible

Translate the full world through this bamboo system:

- shape must become basket-born, shield-born, conical, latticed, segmented, rimmed, or strip-built
- form must become assembled and hollow rather than dense and carved
- space must become construction-space and use-space rather than ordinary scenic space
- light must reveal weave direction, strip thickness, openings, bindings, edges, and internal hollows
- shadow must support lattice depth, overlap, and lightweight structural spacing
- value must stay clear enough to preserve strip order, weave contrast, and rim hierarchy
- movement must feel like bamboo-object physics: carry, bend, cover, shield, store, hang, flex, and support
- environment must also obey bamboo law: characters, animals, shelters, trees, props, mountains, architecture, and ground forms must all feel generated by split-strip assembly, utility silhouette, and lightweight structural rhythm

Material memory must remain visible:

split bamboo, cane binding, woven tension, conical and shield-like object intelligence, and handmade structural plausibility.

Avoid:

generic eco craft, bamboo color mood, decorative weave overlays, furniture-catalog styling, ordinary realism with bamboo props, pottery-like solid mass, and surface-only natural-material treatment.

The final result must feel like a true Meghalaya bamboo world: split-strip, assembled, woven, bound, lightweight, utilitarian, and fully translated across the whole frame.

Reusable Variable Template

Create [SUBJECT / SCENE] using the full visual grammar of Meghalaya bamboo-and-cane craft.

Core style system to preserve:

- split-strip construction logic
- utility-born form identity
- weave / bind / rim / lattice structure
- lightweight hollow volume
- basket / shield / mat / assembly intelligence
- constructable hand-built plausibility
- whole-frame consistency under one bamboo-generated world

Translate the scene like this:

- [MAIN SUBJECT] becomes a bamboo-generated being or form built through segmented, woven, bound, rimmed, and utility-born structure rather than generic realism
- [SECONDARY SUBJECTS] obey the same assembly grammar and lightweight build
- [OBJECTS / PROPS] become split-strip constructed forms with believable weave, rim, and hollow structure
- [ANIMALS / TREES / LANDSCAPE / ARCHITECTURE] become bamboo-generated forms: latticed, conical, segmented, framed, sheltered, carried, or structurally woven
- [ENVIRONMENT / BACKGROUND] becomes organized through assembly rhythm, structural spacing, hollow forms, and utility logic
- [LIGHT / SHADOW] become construction-revealing rather than atmospheric
- [SPACE / DEPTH] become built structural space rather than scenic depth
- [MOVEMENT / ACTION] become bamboo-object movement: bend, flex, carry, cover, bind, suspend, shelter, and store

Keep:

split-strip law, utility silhouette, constructable weave, hollow volume, hand-built logic, structural rhythm.

Avoid:

generic bamboo decor, surface weave pattern, basket styling only, ordinary realism with bamboo props, monolithic shapes, eco-lifestyle mood.

The final result must feel like the whole world was generated by Meghalaya bamboo assembly law.

Image-to-Image

Convert this source image into an authentic Meghalaya bamboo-and-cane world.

Preserve the source image's subject count, basic action, pose relationships, and readable scene meaning, but rebuild the entire image through split-strip utility-object logic. Do not simply add bamboo texture or weave pattern. Reconstruct all visible forms so that shape, form, light, shadow, value, movement, and environment obey bamboo assembly law.

The transformed image must become:

- assembly-born rather than realism-born
- woven and bound rather than surface-patterned
- lightweight and hollow rather than dense
- utility-born rather than decor-born
- constructable rather than stylized without structure
- unified across figures, animals, props, shelters, landforms, trees, architecture, and background

Do not let only baskets or shields become Meghalaya bamboo while the rest of the frame stays generic.

Do not let weave become mere decoration.

Do not let material color replace structural law.

The final result must feel like the source image has been rebuilt by a bamboo-and-cane civilization, not decorated with bamboo texture.

V2 — Artisan Translation

Universal Hard Prompt

Create a creative 2D + 3D image world rooted in the bamboo-and-cane construction grammar of Meghalaya. This must not become a normal stylized scene with bamboo texture or decorative woven motifs. It should feel like authentic split-strip assembly intelligence has expanded into a broader world where characters, animals, architecture, trees, mountains, props, and atmosphere are all redesigned through bamboo law.

Keep the deep structure unchanged:

- split-strip construction remains primary
- utility-born form remains source-rooted
- weave and rim logic remain structural
- lightweight hollow build remains visible
- constructable assembly remains believable
- the whole frame remains bamboo-generated, not bamboo-decorated

Now let the world become richer:

- characters can be built from segmented, bent, bound, latticed, shield-like, or conical body construction

- animals can inherit basket-body, rim-joint, woven-shell, and lightweight frame intelligence
- architecture can behave like shelters, frames, latticed partitions, woven pavilions, and bamboo-built mountain forms
- trees, leaves, rocks, and landscape can become segmented, bound, structural, and assembly-led rather than naturalistic
- shadows can deepen through openings, overlaps, and layered strip systems
- space can become a world of frames, hollows, lattice depth, and structural intervals rather than ordinary landscape

Translate everything:

color, shape, line, form, light, shadow, volume, depth, character, object, animal, architecture, environment, and total scene behavior must all be rebuilt through split-strip bamboo grammar.

Avoid:

generic bamboo fantasy, woven decoration, eco mood design, surface-lattice passes, furniture-style realism, or realism-first worlds with bamboo props.

The final result must feel like Meghalaya bamboo craft itself has generated an imaginative unified 2D + 3D world.

Reusable Variable Template

Create [SUBJECT / SCENE] as a creative 2D + 3D translation rooted in the bamboo-and-cane world of Meghalaya.

Preserve these style-core rules:

- split-strip law remains primary
- utility silhouette remains source-rooted
- weave, bind, and rim remain structural
- hollow lightweight build remains visible
- constructable assembly remains believable
- the whole frame remains generated by bamboo logic

Translate the scene like this:

- [MAIN SUBJECT] becomes a bamboo-generated figure or form built from segmented assembly, woven structural rhythm, rims, bindings, and utility-born shape
- [SECONDARY SUBJECTS] obey the same lightweight construction law
- [ANIMALS / OBJECTS / PROPS] become assembled bamboo beings or forms with real lattice, strip order, and hollow structure
- [ARCHITECTURE / MOUNTAINS / TREES / GROUND / BACKGROUND] become bamboo-world forms: framed, latticed, conical, shielded, partitioned, and structurally bound
- [ENVIRONMENT] becomes a construction-world of weave, frame, support, shelter, and hollow spatial order
- [LIGHT / SHADOW] reveal structural openings, overlaps, and strip depth
- [SPACE / DEPTH] become frame-space and lattice-space instead of ordinary scenic depth

- [MOVEMENT / ACTION] become flex, bend, carry, cover, bind, suspend, and assembly-world interaction

Keep:

bamboo-generated world law, utility structure, constructable weave, lightweight build, split-strip intelligence.

Avoid:

bamboo texture pass, decorative lattice, eco fantasy mood, ordinary stylized characters, monolithic forms, prop-only bamboo conversion.

The final result must feel like the world was redesigned by Meghalaya bamboo assembly intelligence.

Image-to-Image

Convert this source image into a creative 2D + 3D Meghalaya bamboo-and-cane world.

Preserve the source image's core action, readable relationships, and scene meaning, but rebuild every visible element through split-strip construction logic. Do not stop at adding weave pattern or bamboo color. Reconstruct shape, form, light, shadow, volume, depth, character design, environment, and spatial behavior so the whole image behaves like a world generated by bamboo craft.

The transformed image must become:

- assembly-born rather than prop-styled
- woven and bound rather than merely patterned
- lightweight and hollow rather than dense
- utility-generated rather than decorative
- structurally believable rather than fantasy by surface treatment
- unified across people, animals, props, shelters, trees, landforms, architecture, and full background

Do not let only selected objects become bamboo.

Do not let the environment remain generic.

Do not let texture replace structural law.

The final result must feel like Meghalaya bamboo craft has expanded into a full imaginative world-state.

V3 — 3D / Realistic / Cinematic Translation

Universal Hard Prompt

Create a believable full 3D dimensional world generated from the bamboo-and-cane construction grammar of Meghalaya. This must not become ordinary realism with a few baskets and shields inserted. It must feel like the entire world has become real under split-strip assembly law: weave, bind, rim, lattice, conical form, hollow lightweight structure, and utility-born design controlling every visible element.

Translate the full style into dimensional reality:

- shape must remain assembly-born, segmented, woven, rimmed, and utility-driven
- form must remain split-strip constructed and hollow rather than dense and monolithic
- color must remain subordinate to bamboo structural behavior
- light must reveal weave depth, strip thickness, openings, bindings, and hollow volume
- shadow must reinforce lattice structure, overlap, and airy depth
- volume must behave like real bamboo-built volume: light, framed, woven, bent, and supported
- depth must be built through structural intervals, partitions, hollows, and lattice-space rather than generic scenic depth
- characters, animals, props, trees, shelters, mountains, buildings, and all environmental structures must feel generated through bamboo craft law, not merely styled by it

Keep realism under bamboo control:

believable strip thickness, true weave plausibility, real hollow structure, bound joints, lightweight utility identity, and total assembly-world coherence.

Avoid:

ordinary realism with bamboo props, basket decor, woven pattern overlays, furniture-showroom realism, monolithic shapes, surface-only bamboo treatment, or generic eco worlds.

The final result must feel like Meghalaya bamboo craft itself has become a believable living world.

Reusable Variable Template

Create [SUBJECT / SCENE] as a full 3D realistic dimensional world generated from the bamboo-and-cane grammar of Meghalaya.

Style system that must remain unchanged:

- split-strip construction law
- utility-born shape identity
- weave, bind, rim, and lattice structure
- lightweight hollow volume
- constructable hand-built plausibility
- whole-frame bamboo-generated coherence

Translate the scene like this:

- [MAIN SUBJECT] becomes a fully dimensional bamboo-generated being or form built from segmented structure, woven assembly, rims, bindings, and utility silhouette
- [SECONDARY SUBJECTS] obey the same assembly law
- [ANIMALS / OBJECTS / PROPS] become believable bamboo-generated forms with real lattice, hollow volume, and structural logic
- [ARCHITECTURE / MOUNTAINS / TREES / GROUND / BACKGROUND] become real spatial forms organized by frames, partitions, weave, shelter logic, and bound structure
- [LIGHT / SHADOW] become realistic but still assembly-revealing
- [SPACE / DEPTH] become believable structural depth rather than generic realism-space
- [MOVEMENT / PHYSICS] become real bamboo-world movement: bend, flex, carry, suspend, cover, shelter, and support

Increase:

material conviction, structural depth, weave realism, hollow volume, spatial completion, assembly-world integration.

Do not lose:

split-strip intelligence, utility law, constructable weave, lightweight build, bamboo-generated world logic.

Avoid:

normal realism with bamboo accents, basket decor realism, furniture mood, surface-only weave treatment, monolithic forms, or prop-only bamboo conversion.

The final result must feel like a real Meghalaya bamboo world.

Image-to-Image

Convert this source image into a full 3D realistic Meghalaya bamboo-and-cane world.

Preserve the source image's subject count, readable action, and main relationships, but rebuild all visible forms through split-strip construction logic. Replace ordinary realism with weave law, rim and lattice structure, lightweight hollow volume, bound joints, and bamboo-generated spatial behavior.

The transformed image must become:

- assembly-generated rather than object-decorated
- woven and bound rather than merely patterned
- lightweight and hollow rather than dense
- utility-born rather than decor-born
- real in volume but still controlled by bamboo craft law
- unified across figures, animals, props, shelters, trees, architecture, landforms, and full environment

Do not let only selected props become bamboo.

Do not let realism take over.

Do not leave the environment generic.

The final result must feel like Meghalaya bamboo craft has become believable reality.
