

The Agrarian-Industrial Blend - Haryana

V1 — Authentic Style

Universal Hard Prompt

Create an image built from a **Haryana regional production-world system** where **high-intensity cultivated plains, mechanized agriculture, roads and storage networks, agro-processing linkages, and industrial/manufacturing presence** coexist inside one shared environment. Do not treat this as a farm scene with a factory in the background, do not treat it as an industrial scene with decorative fields, and do not treat it as a texture-transfer exercise.

Build the full frame as if the world itself is organized by **productive coexistence**. The land must feel actively cultivated, managed, repeated, and infrastructure-linked. The agricultural side must show real production logic through field order, machine support, movement, loading, storage, irrigation presence, or procurement-world adjacency. The industrial side must feel structurally real through sheds, blocks, processing yards, warehouse zones, movement corridors, machine-bearing edges, or manufacturing presence. The two must belong to one operational system, not two separate visual halves.

Transform the entire image through this grammar, not just surfaces. Change:

- the **base ground logic** so it feels like worked cultivated land, not generic scenic terrain
- the **form logic** so buildings, sheds, roads, machines, storage zones, and fields all feel production-born
- the **space construction** so foreground, middle ground, and background are organized by work, movement, and throughput rather than pretty depth
- the **shadow and light logic** so shadows clarify productive zones, built mass, machinery, fields, and routes rather than only creating mood
- the **environment logic** so all visible land, roads, infrastructure, buildings, and atmospheric space belong to one Haryana agrarian-industrial world

If people appear, they must feel tied to cultivation, machinery, storage, loading, processing, transport, or industrial work. If machines appear, they must feel functionally embedded rather than symbolic. If roads appear, they must feel like movement channels between productive zones. If fields appear, they must feel intensely used and managed, not scenic.

Color and material behavior should come from one shared working landscape: crop surfaces, soil, dust, metal, concrete, painted machinery, sheds, storage, and traffic-worn infrastructure. Do not separate “natural beauty” and “industrial harshness” into two unrelated moods. The world must feel like a single plains-state production ecosystem.

Do not generate:

- scenic pastoral farmland
- generic industrial landscape
- tractor plus factory symbolism
- texture-only transformation
- generic realism with Haryana-coded props
- visual collage where agriculture and industry do not structurally reshape the same world

The final image must feel like a **Haryana productive landscape where cultivation, mechanization, storage, movement, processing, and industry all co-generate the full frame.**

Reusable Variable Template

Create **[SUBJECT / SCENE / LANDSCAPE TYPE]** using the visual grammar of a **Haryana agrarian-industrial production world**, where **cultivated land, mechanized agriculture, movement infrastructure, storage/procurement systems, agro-processing, and industrial presence** coexist inside one working environment.

Core style system to preserve:

- cultivated production-land identity
- mechanized agrarian support
- industrial/manufacturing presence
- roads, storage, and throughput logic
- coexistence, not visual contrast
- plains-scale horizontal organization
- whole-frame productive coherence

Translate the image like this:

- **[GROUND / FIELD STRUCTURE]** becomes managed cultivated land with real production order
- **[MACHINES / VEHICLES / IMPLEMENTS]** become operational support inside the same system, not symbolic props
- **[SHEDS / FACTORIES / BLOCKS / STORAGE]** become structurally linked industrial or processing presence
- **[ROADS / ROUTES / YARDS / LOADING EDGES]** become active movement channels between production zones
- **[PEOPLE / LABOR / ACTIVITY]** become tied to cultivation, handling, processing, transport, or industrial work
- **[FULL ENVIRONMENT]** must feel rebuilt through one shared Haryana production logic

Mandatory transformation rule:

Do not transfer only texture, palette, or surface cues.

Also transform:

- form
- silhouette
- space and depth
- light and shadow
- object relationships
- environment base
- movement hierarchy
- production-world organization

Keep:

- agriculture and industry as co-equal
- system logic stronger than symbolism
- worked land truth
- industrial adjacency truth
- infrastructure presence
- whole-frame integration

Avoid:

- scenic farming
- generic factories
- decorative collage
- moodboard realism
- surface-only transfer
- generic realism with local cues added later

Image-to-Image

Convert this source image into a **Haryana agrarian-industrial production world**.

Preserve the source image's main subject count, overall spatial readability, and major action logic, but rebuild the full frame through **high-intensity cultivated land, mechanized farm support, storage and movement infrastructure, agro-processing linkage, and industrial/manufacturing presence**. Replace any generic field, generic road, generic building, generic factory, or decorative rural-industrial contrast with one coherent productive environment.

If the source image contains land, make it behave like actively managed cultivated ground. If it contains roads, make them function as movement channels through a production system. If it contains buildings, convert them into storage, processing, manufacturing, logistics, or industrial-support forms that belong to the same world as the fields. If it contains machinery,

make it operational and system-linked rather than symbolic. If it contains workers, tie them to actual production tasks.

Do not just add crop texture, dust, tractors, sheds, or factory silhouettes. Do not keep the original environment base underneath. Rebuild the full scene so that **ground, machines, buildings, roads, storage, shadows, and atmosphere all behave like one Haryana agrarian-industrial ecosystem**. The final image must feel born from the style-system, not covered with it.

V2 — Artisan Translation

Universal Hard Prompt

Create a **creative 2D + 3D translation** of a **Haryana agrarian-industrial production world**. This is not literal documentary realism, not texture transfer, and not symbolic collage. It should build a new image-language that still stays rooted in the source grammar of **cultivated land, mechanized agriculture, processing, storage, movement, and industrial coexistence**.

Let the style actively transform the whole frame. The cultivated plains should reshape the image through strong land-order logic, repeated productive bands, corridor movement, and operational spacing. Industrial forms should not be generic boxes; they should evolve out of the same grammar of throughput, modular production, handling, loading, and adjacency to working land. Roads, yards, storage edges, and field divisions should become major compositional engines, not background fillers.

This version must change more than texture. Transform:

- **form** so fields, machines, warehouses, roads, industrial blocks, and storage structures all belong to one hybrid grammar
- **shadow** so work zones, corridor depth, and productive hierarchy become visually legible
- **base-world structure** so the land is not generic scenic ground, but a worked and connected production surface
- **space** so agriculture and industry interlock spatially rather than sit in separate layers
- **object logic** so machinery, transport, storage, and field systems feel mutually dependent
- **environment logic** so the sky, dust, atmosphere, edges, and built-ground relation all support one productive identity

The image should feel more visually reinterpreted than the source-faithful version, but it must stay faithful to the deep core:

- cultivation must remain productive, not decorative

- industry must remain embedded, not symbolic
- movement and processing must still organize the frame
- the whole world must still feel like one Haryana system

Do not generate:

- generic concept-art of “modern rural India”
- collage-like factory-versus-farm contrast
- ordinary 3D realism with motif cues
- pretty landscape with industrial stickers
- industrial futurism with crop overlays
- surface-only styling

The final result must feel like **the internal grammar of Haryana’s agrarian-industrial coexistence has reauthored the form, massing, shadow, spacing, object relations, and world structure of the entire image.**

Reusable Variable Template

Create **[SUBJECT / SCENE / REGION-TYPE]** as a **creative 2D + 3D translation** of a **Haryana agrarian-industrial production world.**

Preserve these style-core rules:

- cultivated land remains production land
- mechanized agrarian support remains active
- industrial/manufacturing presence remains structurally real
- roads, yards, and storage remain connectors
- agriculture and industry remain part of one system
- the frame must be rebuilt, not decorated

Translate the frame like this:

- **[FIELD / GROUND SYSTEM]** becomes a strong productive land structure with repeated working order
- **[MACHINES / EQUIPMENT / VEHICLES]** become part of a unified operational grammar
- **[BUILDINGS / SHEDS / FACTORY EDGES / STORAGE]** become modular productive forms shaped by throughput logic
- **[ROADS / CORRIDORS / YARDS / LOADING ZONES]** become major spatial organizers
- **[PEOPLE / LABOR / ACTIVITY]** become embedded in cultivation, processing, transport, or industrial handling
- **[ATMOSPHERE / DISTANCE / SHADOW]** become part of the production-world readability, not just mood

Mandatory transformation rule:

Do not apply only texture, color, costume, or props.

Also transform:

- form
- massing
- silhouette
- depth
- shadow behavior
- environment base
- object hierarchy
- spatial organization
- production relationships

Let these become richer:

- field-to-industry interlock
- corridor rhythm
- modular production spacing
- shadow-defined work zones
- productive depth
- full environmental integration

Keep unchanged:

- coexistence, not contrast
- system logic stronger than symbolism
- working-land truth
- industrial adjacency truth
- whole-frame coherence

Avoid:

- normal realism with local cues
- pretty concept-art landscape
- symbolic factory-in-the-distance staging
- decorative crop textures
- pasted industrial surfaces
- any split-world composition

Image-to-Image

Convert this source image into a **creative 2D + 3D Haryana agrarian-industrial production world**.

Preserve the source image's main subject count, basic scene readability, and overall action structure, but reconstruct the full frame through **cultivated production-land order, mechanized agrarian systems, movement corridors, storage and processing infrastructure, and industrial/manufacturing adjacency**. Let the world become more formally reauthored and more spatially intentional than the original, but keep it fully source-rooted.

Rebuild the land so it behaves like productive ground, not generic terrain. Rebuild buildings so they act like storage, processing, logistics, or manufacturing forms belonging to the same productive system as the land. Rebuild roads and movement edges so they actively connect agricultural and industrial functions. Rebuild shadows and depth so they reveal operational zones and throughput structure. Rebuild the atmosphere so it supports one working-plains identity.

Do not just add machinery, crop texture, warehouses, or industrial backdrops. Do not keep the original base-world underneath. Rebuild the full image so **form, shadow, ground, buildings, movement, and environment all shift into one coherent Haryana agrarian-industrial grammar**. This must feel like a full system translation, not a surface treatment.

V3 — 3D / Realistic / Cinematic Translation

Universal Hard Prompt

Create a **full 3D realistic dimensional world** generated from a **Haryana agrarian-industrial production system**. This is not generic realism with local cues added later. It is a believable real world in which **cultivated plains, mechanized agriculture, roads and storage, agro-processing links, industrial/manufacturing presence, and shared productive infrastructure** govern every visible element.

Translate the entire style-system into reality. Every part of the frame must adapt:

- ground and fields must behave like actively worked production land
- roads, mandis, storage yards, or movement edges must behave like throughput systems
- machines and implements must behave like real operational support
- sheds, industrial units, and processing forms must behave like real manufacturing or logistics presence
- shadows and depth must reveal actual productive hierarchy
- atmosphere and environmental scale must support one plains-based working region

This version must not stop at surface realism. It must rebuild:

- **form** so buildings, fields, machines, and storage structures all belong to the same production-world logic

- **base** so the environment itself becomes a productive Haryana plains system
- **space** so agriculture and industry interlock in believable depth
- **shadow and light** so work zones, circulation, and operational massing are clear
- **material behavior** so soil, crop, dust, metal, concrete, painted machinery, sheds, and storage all coexist under one functional logic
- **object-world relations** so nothing looks pasted in from another visual language

If people appear, they must belong to cultivation, handling, transport, processing, or industrial work. If no people appear, the world must still feel actively worked, not idle. The image should feel like a living production landscape, not a picturesque scene.

Do not generate:

- photoreal farm scenery with industrial hints
- photoreal factory landscape with decorative crops
- generic realism with tractors and warehouses inserted
- cinematic prettiness replacing system logic
- symbolic contrast between “rural” and “industrial”
- texture overlays on a generic world

The final image must feel like **Haryana’s agrarian-industrial coexistence has become believable reality**, where every element in the frame is structurally controlled by one shared productive system.

Reusable Variable Template

Create **[SUBJECT / SCENE / LANDSCAPE TYPE]** as a **full 3D realistic dimensional world** generated from a **Haryana agrarian-industrial production system**.

Style system that must remain unchanged:

- cultivated production-land remains primary
- mechanized agrarian support remains active
- industrial/manufacturing presence remains structurally real
- roads, storage, and movement remain connective systems
- agriculture and industry remain one integrated world
- the entire environment must be rebuilt through this grammar

Translate the image like this:

- **[GROUND / FIELD WORLD]** becomes fully dimensional worked land with real productive order
- **[MACHINES / VEHICLES / IMPLEMENTS]** become operational, believable, and system-linked
- **[SHEDS / INDUSTRIAL BLOCKS / STORAGE / PROCESSING ZONES]** become materially real productive forms

- **[ROADS / YARDS / CORRIDORS / LOADING EDGES]** become spatially convincing movement channels
- **[PEOPLE / LABOR / ACTIVITY]** become tied to real production roles if present
- **[FULL ENVIRONMENT]** becomes a coherent Haryana working-plains reality rather than generic realism

Increase:

- form realism
- productive depth
- shadow-defined work zones
- land-to-industry integration
- environmental completion
- system-level coherence

Do not lose:

- coexistence, not contrast
- production-world logic
- cultivated-land truth
- industrial adjacency truth
- base-world transformation
- whole-frame style control

Avoid:

- generic realism with local props
- scenic farming
- decorative industry
- symbolic tractor-plus-factory imagery
- surface-only translation
- mainstream AI prettiness replacing the source system

Image-to-Image

Convert this source image into a **full 3D realistic Haryana agrarian-industrial production world**.

Preserve the source image's main subject count, overall layout, and basic scene readability, but rebuild every visible element through **cultivated production-land structure, mechanized agrarian support, roads and storage systems, agro-processing linkage, and industrial/manufacturing presence**. Replace generic terrain, generic buildings, decorative fields, symbolic factories, and scenic depth with one believable productive Haryana world.

Rebuild the ground as active cultivation land. Rebuild roads and yards as movement systems. Rebuild buildings as real storage, processing, manufacturing, or industrial-support structures. Rebuild machines as real operational objects. Rebuild shadows and depth so they clarify working zones and system relationships. Rebuild the environment so fields, transport, storage, and industrial forms all feel like they belong to the same plains-based productive region.

Do not simply add realism to a rural-industrial collage. Do not keep the original image logic underneath. Do not let the result become generic photorealism with Haryana-coded elements layered on top. Rebuild the whole frame so it feels as if **the entire scene originally emerged from a single Haryana agrarian-industrial system**, with full transformation of form, shadow, base, material, space, and environment.
