

coconut-shell - Andaman & Nicobar

V1 — Authentic Style

Universal Hard Prompt

Create a fully self-contained image in the authentic visual grammar of Coconut-shell craft from Andaman & Nicobar.

Build the entire result from actual coconut-shell logic. The main form must feel made from real coconut shell: hard shell body, curved shell memory, hollow-derived structure, natural shell thickness, cut edges, smoothened interior and exterior surfaces, restrained brown shell tone, and handmade finish.

Keep the object or object-group close to true source behavior: compact scale, utility-plus-decor intelligence, handcrafted shaping, sanding, polishing, and simple engraved or perforated detail only if needed. The result should feel like a real island coconut-shell craft object, not a generic tropical souvenir.

Use shell-born form first. Let the shell itself generate the design. The object should read as bowl, box, lamp, ornament, jewellery, container, or another believable shell-crafted article made by hand. Keep the surface materially honest and shell-specific.

Do not make it wooden, resin-like, ceramic-like, plastic-like, luxury-designer, overly decorative, beach-resort styled, tribal-fantasy, or eco-brand generic. Do not use coconut only as motif or theme. The object must feel physically born from coconut shell.

Reusable Variable Template

Create [object / object-group / crafted article] in the authentic visual grammar of Coconut-shell craft from Andaman & Nicobar.

The full result must be built from real coconut-shell body logic: hard curved shell form, hollow-derived shape memory, natural shell thickness, smooth cut edges, hand-shaped profile, restrained brown shell tone, and handmade polished or semi-polished finish.

Show [main object purpose / use / arrangement]. Keep the design compact, shell-born, handcrafted, and materially specific. Let the shell determine the object's form, edge behavior, and structure. If detail is added, use only shell-appropriate engraving, drilling, perforation, or small assembled shell parts.

Keep it source-faithful, simple, tactile, and island-made in feeling. Do not turn it into tropical décor, generic brown craft, woodcraft, resin product, luxury homeware, or a normal object decorated with coconut references.

Image-to-Image

Use the input image only for object identity, broad shape intention, placement, and function. Rebuild the full result in the authentic visual grammar of Coconut-shell craft from Andaman & Nicobar.

Transform the object completely so it feels physically made from real coconut shell: curved shell-derived structure, hollow-form memory, visible shell thickness, cut and smoothened edges, natural brown shell tone, handcrafted sanding and polishing, and shell-born object construction.

Preserve the object's general role, but replace the whole material and form logic with true coconut-shell craft behavior. The result must feel like a real handcrafted shell object from the islands' local craft tradition.

Do not apply shell texture only. Do not keep wood, ceramic, metal, resin, or plastic object logic underneath. Do not make it a generic souvenir or designer product. The object must become shell-born in its actual form, not shell-themed on the surface.

V2 — Artisan Translation

Universal Hard Prompt

Create a fully self-contained image in the visual grammar of Coconut-shell craft from Andaman & Nicobar, translated into richer artisan dimensional form while staying completely faithful to the source system.

Because this source is already an object craft, do not "make it 3D" in a generic way. Instead, deepen the same shell grammar: stronger tactile objecthood, richer shell-part relationships, clearer edge definition, more deliberate crafted assembly, more readable carved, drilled, or engraved depth, and more believable handcrafted presence.

The object or object-group must still be made from real coconut-shell logic: curved shell memory, hollow-derived form, natural shell thickness, hand-shaped edges, restrained brown shell tone, and shell-specific finish. Increase structural richness, but keep it humble, handcrafted, and source-rooted.

Let the result feel like skilled island artisans expanded the shell craft into a richer dimensional object world. Improve material clarity, tactile depth, and composition readability, but only through shell logic.

Do not turn it into premium homeware, showroom product design, generic upscale décor, resin-sculpted object, luxury tropical styling, or a normal product with shell accents. The deeper dimensionality must still feel shell-born and artisan-made.

Reusable Variable Template

Create [object / object-group / crafted arrangement] in Coconut-shell craft grammar from Andaman & Nicobar, translated into richer artisan dimensional form.

Build the full result from actual coconut-shell logic: shell curvature, hollow-derived form memory, natural shell thickness, smooth cut-edge behavior, restrained brown shell tone, hand-finished surface, and believable shell-based assembly. Show [main object purpose / arrangement / crafted use], but make the whole result obey one shell-born material system.

Increase tactile richness, edge readability, object presence, engraved or perforated depth where needed, and crafted structural clarity compared to a source-truth version. Let it feel like a more resolved artisan expansion of the same shell craft, not a new design language.

Do not make it a premium designer object, generic handmade lifestyle product, luxury décor piece, woodcraft substitute, or shell-textured normal object.

Image-to-Image

Use the input image only for object identity, arrangement, and broad design intent. Rebuild the full result in Coconut-shell craft grammar from Andaman & Nicobar with richer artisan dimensional translation.

Transform every visible object into a shell-born handcrafted construction: real coconut-shell curvature, hollow-form memory, shell thickness, cut and smoothed edges, polished or semi-polished shell surface, drilled or engraved detail where appropriate, and stronger tactile object presence.

Increase structural richness, assembly clarity, and material legibility, but keep the source shell grammar unchanged. The final result should feel like a more developed handcrafted shell object-world made by skilled island artisans.

Do not apply shell texture only. Do not keep generic product logic underneath. Do not create luxury product visualization, glossy lifestyle branding, or generic tropical design.

V3 — 3D / Realistic / Cinematic Translation

Universal Hard Prompt

Create a fully self-contained complete world in the visual grammar of Coconut-shell craft from Andaman & Nicobar, translated into a believable fully resolved dimensional world where every important visible form belongs to the same shell-born system.

This is not a cinematic makeover and not generic realism with one shell object inserted. Keep the same coconut-shell craft DNA unchanged: shell curvature, hollow-form memory, natural shell thickness, cut-edge truth, restrained shell-brown palette, handcrafted finishing, and compact object intelligence.

Build a fully resolved shell-world or shell-object ecology with stronger spatial completion, clearer near-to-far consistency, richer tactile shell material, stronger object presence, and full-world coherence. If the image stays at object scale, make the entire object-family or arrangement feel completely governed by shell logic. If the image expands into a wider crafted world, make all major visible forms inherit the same shell-born material intelligence.

The final result must feel like coconut-shell craft itself has reached its most complete believable dimensional form without becoming luxury décor, product-ad realism, tropical resort styling, or generic design-world polish.

Do not let realism overpower shell grammar. Do not make one shell object sit inside a normal room or normal world. Every important visible element must belong to the same shell-born style system.

Reusable Variable Template

Create [object / arrangement / expanded crafted scene / shell-world situation] as a fully resolved believable dimensional world in Coconut-shell craft grammar from Andaman & Nicobar.

The full result must obey one shell-born material system: real coconut-shell curvature, hollow-form memory, natural shell thickness, cut-edge behavior, shell-brown tonal identity, hand-finished surface, and believable handcrafted object intelligence. Show [main object purpose / event / arrangement / world condition], but make all important visible elements belong to the same shell-based grammar.

Increase full-world completion, material believability, near-to-far consistency, tactile richness, object presence, and spatial coherence compared to V2, while keeping the exact same source shell DNA. The result must feel complete and believable, but never generic-realistic or designer-premium.

Do not create a normal décor world with shell accents, a luxury tropical interior, a cinematic shell-product ad, or a realism-first environment with one handcrafted insert.

Image-to-Image

Use the input image only for object identity, arrangement, and broad world structure. Rebuild the entire result as a fully resolved believable dimensional world in Coconut-shell craft grammar from Andaman & Nicobar.

Transform every important visible element into one continuous shell-born system: real coconut-shell body logic, shell curvature, hollow-form memory, shell thickness, cut and polished edges, restrained brown shell tone, handcrafted engraved or drilled detail where needed, and full material believability. Preserve the broad scene intent, but replace the entire image-making logic with coconut-shell craft intelligence.

The result must feel fully complete and spatially coherent without changing the style-core. Keep it shell-born, handmade, and source-rooted from foreground to background or from object-center to full object ecology.

Do not stylize one object only. Do not keep normal materials underneath. Do not make a realistic room, tropical lifestyle setting, luxury product shoot, or shell-themed generic design world.
